

Glaucoma Treatment May Reduce Need for Eye Drops

Dr. Samuelson and the team of research professionals at Minnesota Eye Consultants, P.A. are currently evaluating a new treatment for patients with mild to moderate glaucoma and cataracts. This trabecular micro-bypass stent is implanted in the eye during cataract surgery and may help reduce or eliminate the need for eye drops in some patients. The stent is designed to reduce intraocular pressure and prevent further vision loss due to glaucoma.

For more information about whether you are an eligible candidate for this research study, talk to your doctor or call the research department at Minnesota Eye Consultants, P.A. in Bloomington 612-813-3607 or email research@mneye.com.
