

If you or someone you know has age-related macular degeneration (AMD) and has had a cataract removed, you may be a candidate for a new clinical trial that might help you regain some lost vision. Minnesota Eye Consultants is one of only 20 sites in the country participating in a new study to evaluate the safety and effectiveness of a device called the Implantable Miniature Telescope (by Dr. Isaac Lipshitz) implant for patients with End-Stage AMD who have already had a cataract removed from the eye that will be implanted. If the trial is successful, many more people could potentially be helped by this procedure.

The telescope implant is not a cure for age-related macular degeneration. Learn more at Centrasight.com or contact us by calling 855-550-1040 or patientcare@centrasight.com.
